ABSTRACT

In the past decade, new advances in tumor treatment have been made. Immunotherapy works by activating the patient's own immune system to target cancer cells. CAR-T cell therapy has shown significant activity in certain cancers, and two CAR-T therapies, Kymriah and Yescarta, have been approved by the FDA for the treatment of acute lymphoblastic leukemia and large B-cell lymphoma.
However, despite advances in CAR-T cell therapy, scientists have not yet fully determined how CAR-T cells function in structure. Recently, researchers from the Moffitt Cancer Center in the United States have solved this problem and described the mechanism of action of these new drugs. The results were published in *Science Signaling*. it still remains a big challenge in the field of drug discovery.
