ABSTRACT

This Stata code was generated for a study using a sibling design to disentangle family and neighbourhood effects on income, with contextual sibling pairs used as a control group. The sibling design helps us to separate the effects of childhood family and neighbourhood context from adult neighbourhood experiences. We use data from Swedish population registers, including the full Swedish population.

The GeoSweden data used in this paper are third party data owned by the Institute for Housing and Urban Research, Uppsala University. Due to the sensitive nature of the data, ethical and legal restrictions apply to this data being publicly shared. These conditions are imposed by Statistics Sweden. The GeoSweden data can only be analysed in a secure safe setting, and scholars interested in accessing the data can apply to take part in GeoSweden-based collaborative research under the leadership of a researcher based at the Institute for Housing and Urban Research in Uppsala, Sweden. For further information about the data access please see <https://www.ibf.uu.se/research/our-researchers/geosweden/>

The Stata code was generated by Lina Hedman (Uppsala University), for a research project together with Maarten van Ham (Delft University of Technology) and David Manley (University of Bristol).

The research leading to these results has received funding from the European Research Council under the European Union's Seventh Framework Programme (FP/2007-2013) / ERC Grant Agreement n. 615159 (ERC Consolidator Grant DEPRIVEDHOODS, Socio-spatial inequality, deprived neighbourhoods, and neighbourhood effects).
