ABSTRACT

Lambda phage is a bacteriophage that infect Gam- bacteria, such as E.coli, through the outer membrane protein LamB. We use the Lambda phage to characterize if the AEGIS's display system has been properly expressed.

GUIDELINES

Make sure to have all work surface and material clean before the start.

SAFETY WARNINGS

The phage Lambda is under the white list of microorganism. However, it is extremely infective and could contaminate an entire laboratory if not handled with care.
