### ABSTRACT

### PROTOCOL STATUS

#### Working

We use this protocol in our group and it is working

- 1 The dengue virus strains obtained from cell culture were extracted by TGuide S32 magnetic bead method DNA/RNA extraction kit of Tiangen Biochemical Technology (Beijing) Co., Ltd. and amplified by one step RNA PCR Kit (Code No: DRR057A) reagent of Bao Bioengineering (Dalian) Co., Ltd.
- 2 The full sequence of E gene amplified by primer sequence was D1 (E) F: CAA GAA CCG AAA CA / GT GGA TGT C; D1 (E) R: GGC TGA TCG AAT TCC ACA CAC, and the length of amplified fragment was 1849 bp.
- 3 Reaction conditions: reverse transcription at 50 °C 30 minutes, reverse transcription at 94°C 2 minutes, reverse transcription at 94°C 30 seconds, reverse transcription at 52°C 30 seconds, reverse transcription at 72°C 2 minutes, 40 cycles and extension at 72°C. The amplified product was 5 µL, and 1.5% agarose gel electrophoresis was used to confirm the reaction product according to Marker position.
