

NEXTflex™ Small RNA Sequencing for Total RNA Starting Material

Bioo Scientific

Abstract

This protocol is for the NEXTflex™ Small RNA Sequencing Kit v2, designed to prepare small RNA libraries for sequencing using Illumina® sequencers. This kit utilizes adapters with randomized ends to greatly reduce sequence bias in small RNA sequencing library construction.

Please see the full manual for additional details.

(The protocol below describes preparation of small RNA sequencing libraries from **Total RNA** starting material; for small RNA samples, please see this protocol.)

Guidelines

Contents, Storage and Shelf Life

The NEXTflex¢Â \square ¢ Small RNA Sequencing Kit v2 contains enough material to prepare 24 RNA samples for IlluminaÃ \square Â® compatible next-generation sequencing. The shelf life of all reagents is 6 months when stored properly. All components can safely be stored at -20Ã \square °C, except: Adapter Depletion Solution, Resuspension Buffer, Nuclease-free Water, and Elution Buffer, which can be stored at room temperature.

Kit Contents	Amount
RED CAP	
3' NEXTflex™ 4N Adenylated Adapter	24 μL
AIR™ Ligase	24 μL
AIR™ Ligase Buffer	60 μL
50% PEG	144 μL
Adapter Depletion Solution	750 μL
RNase Inhibitor	26.5 μL

PURPLE CAP	
5' NEXTflex™ 4N Adapter	36 μL
T4 RNA Ligase 1	36 μL
ATP	36 μL

BLUE CAP	
NEXTflex** RT Primer	24 μL
M-MuLV Reverse Transcriptase	48 μL
10X M-MuLV Buffer	96 μL
dNTPs	96 μL
GREEN CAP	
NEXTflex [™] Universal Primer	24 μL
NEXTflex [™] Barcode Primer 1	24 μL
5X DuroTaq Master Mix	120 µL
ORANGE CAP	
6X Loading Dye	150 µL
Ready to Load Low MW Ladder	300 μL
YELLOW CAP	
Resuspension Buffer	1000 μL
WHITE CAP	
Nuclease-free Water	1.5 mL
CLEAR CAP	
microRNA Control	10 μL
CLEAR CAP BOTTLE	
Elution Buffer (10X)*	2 mL

NEXTflexâÂ☐¢ Small RNA Sample Preparation Flow Chart

Starting Material

The NEXTflexâÂ \Box ¢ Small RNA Sequencing Kit v2 has been optimized and validated using total RNA (1 - 10 Ã \Box Â μ g), purified small RNA (from 1 - 10 Ã \Box Â μ g total RNA), and a synthetic miRNA pool (âÂ \Box Â¥100 pg). Best results are obtained with high quality starting material. The use of degraded RNA may result in poor yields or lack of sequencing output data. Bioo Scientific recommends running total RNA on a 1 - 2% agarose gel or examining its integrity using an Agilent Bioanalyzer. High quality total RNA preparations should have an 28S band that is twice as intense as the 18S band of ribosomal RNA. At low concentrations, small RNA is difficult to detect on a gel; however it can be detected using

an Agilent Bioanalyzer Small RNA assay (see Figure 2 in Appendix A). We recommend beginning with total RNA or a preparation of highly enriched small RNA by PAGE selecting small RNAs around 15-45 nt long or using a phenol-based small RNA isolation method such as BiooPureâÂ \Box ¢ (Cat # 5301) for enrichment.

Reagent Preparation

- 1. Vortex and micro centrifuge each component prior to use, to ensure material has not lodged in the cap or the side of the tube.
- 2. Add 18 mL of molecular biology-grade water to each bottle of Elution Buffer (10X) to make a 1X Elution Buffer. Check box on bottle to show water has been added.

Small RNA Starting Material

- 1. Add 10 ̸µL of Nuclease-free Water to each sample and mix well by pipette.
- 2. Add 6 ̸µL of Adapter Depletion Solution and mix well by pipette.
- 3. Add 40 ̸µL of AMPure XP beads and 60 Ã∏µL of ispropanol and mix well by pipette.
- 4. Incubate for 5 minutes.
- 5. Magnetize sample until solution appears clear.
- 6. Remove and discard supernatant.
- 7. Add 180 $\mbox{A} \Box \mbox{A} \mu L$ of freshly prepared 80% ethanol, incubate for 30 seconds, and remove with a P200 or P300 set to 200 $\mbox{A} \Box \mbox{A} \mu L$. Repeat this step for a total of 2 ethanol washes. IMPORTANT: Always use freshly prepared 80% ethanol and do not incubate the bead pellet with 80% ethanol for extended periods.
- 8. Incubate sample for 3 minutes. After one minute, remove all residual liquid that may have collected at the bottom of the well.
- 9. Remove plate from magnetic stand and resuspend bead pellet in 22 ̸µL of Resuspenion Buffer by pipetting volume up and down. Ensure that beads are completely resuspended.
- 10. Incubate 2 minutes. During incubation, add 6 $\tilde{A} \square \hat{A} \mu L$ of Adapter Depletion Solution to a new, empty well.
- 11. Magnetize sample until solution appears clear.
- 12. Transfer 20 ̸ÂμL of supernatant to a new well containing 6 Ã∏ÂμL Adapter Depletion Solution and mix well by pipette.
- 13. Add 40 ÃΠÂμL of AMPure XP beads and 60 ÃΠÂμL of ispropanol and mix well by pipette.
- 14. Incubate for 5 minutes.
- 15. Magnetize sample until solution appears clear.
- 16. Remove and discard supernatant.
- 17. Add 180 $\tilde{A} \square \hat{A} \mu L$ of freshly prepared 80% ethanol, incubate for 30 seconds, and remove with a P200 or P300 set to 200 $\tilde{A} \square \hat{A} \mu L$. Repeat this step for a total of 2 ethanol washes. IMPORTANT: Always use freshly prepared 80% ethanol and do not incubate the bead pellet with 80% ethanol for extended periods.

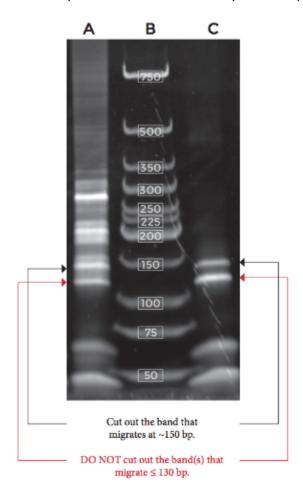

- 18. Incubate sample for 3 minutes. After one minute, remove any residual liquid that may have collected at the bottom of the well.
- 19. Remove plate from magnetic stand and resuspend bead pellet in 12 $\tilde{A} \square \hat{A} \mu L$ of Nuclease-free Water by pipetting. Ensure that beads are completely resuspended.
- 20. Incubate for 2 minutes.
- 21. Magnetize until solution appears clear.
- 22. Transfer 11 Ã□ÂμL of supernatant to a new well. Proceed to Step C: 5âÂ□Â□ NEXTflexâÂ□¢ 4N Adapter Ligation.

PCR Amplification

Step 54.

For each PCR reaction add the following to the 18 μ L purified First Strand Synthesis product (from section "Bead Cleanup"):

5 μL 5X DuroTaq Master Mix

1 μL NEXTflex™ Barcode Primer 1 or Barcoded Primer from NEXTflex™ Small RNA Barcodes Kit 1 μL NEXTflex™ Universal Primer

NOTES

Bioo Scientific 17 Aug 2015

Materials

Bioo Scientific Supplied

GREEN CAP - NEXTflex™ Barcode Primer 1, NEXTflex™ Universal Primer, 5X DuroTaq Master Mix

User Supplied

(Optional) NEXTflex™ Barcode Primer (NEXTflex™ Small RNA Barcodes: 513305, 513306, 513307, or 513308)

Thermocycler

*18 µL Purified First Strand Synthesis product (from section "Bead Cleanup")

PCR Amplification

Step 55.

Cycle as follows: (Make sure thermocycler is above 80°C before placing samples on block)

2 min	95°C	
20 sec	95°C	
30 sec	60°C	Repeat 12 -18 cycles
15 sec	72°C	
2 min	72°C	

Gel Electrophoresis

Step 56.

Add 5 µL of 6X Gel Loading Dye to each PCR product and mix well

NOTES

Bioo Scientific 17 Aug 2015

Materials

Bioo Scientific Supplied

ORANGE CAP - 6X Gel Loading Dye, Ready to Load Low MW Ladder

User Supplied

6% TBE-PAGE Gel

1X TBE Buffer

Nucleic acid stain such as SYBR Gold (Invitrogen)

UV transilluminator or other visualization tool

Clean razor or scalpel

Nuclease-free 1.7 mL microcentrifuge tube

*PCR Product (25 µL) (from section "PCR Amplification")

Gel Electrophoresis

Step 57.

Load purified PCR products onto a 6% TBE-PAGE gel. We recommend leaving 1-2 lanes between samples prepared with the same barcode primer to avoid cross contamination. Samples prepared with different barcodes and that will be sequenced together may be run in adjacent lanes.

REAGENTS

6% TBE PAGE gels (1.0 mm) EC6265BOX by Life Technologies

Gel Electrophoresis

Step 58.

In an adjacent lane load 10 µL of Ready to Load Low MW Ladder.

Gel Electrophoresis

Step 59.

Run the gel with 1X TBE buffer at 200 V until the lower dye band is near the bottom of the gel (0.5-1 cm). The gel should run for approximately 30 minutes. Run times may vary depending on individual equipment.

O DURATION

00:30:00

Gel Electrophoresis

Step 60.

Carefully remove the gel from the glass plates and stain with a nucleic acid stain such as SYBR Gold (Invitrogen) per manufacturer instructions.

Gel Electrophoresis

Step 61.

Visualize gel bands on a UV transilluminator or other gel documentation instrument.

Gel Electrophoresis

Step 62.

Using a clean razor cut out the 150 bp band and place into clean 1.7 mL tube. Do not cut out the 130 bp band; this is adapter dimer product. See Figure 2 in Guidelines for example. The ladder band at 200 bp is twice as intense as the other bands and can be used for orientation.

Nucleic Acid Elution and Purification

Step 63.

Briefly centrifuge the microcentrifuge tube containing the gel slice to collect the gel slice at the bottom of the tube.

NOTES

Bioo Scientific 17 Aug 2015

Materials

Bioo Scientific Supplied

YELLOW CAP - Resuspension Buffer

CLEAR CAP BOTTLE - 1X Elution Buffer (Dilute prior to use as described in the Reagent Preparation section)

User Supplied

Agencourt AMPure XP Magnetic Beads (room temperature)

Isopropanol

80% Ethanol

Nuclease-free 1.7 mL microcentrifuge tubes

Spin-X Centrifuge tube (Sigma)

Sterile disposable pestles (Fisher Cat # K749521-1500 or similar)

Magnetic stand for micrcentrifuge tubes (Life Technologies DynaMag[™] -2 or similar)

*Gel Slice (in 1.7 mL tube) (from section "Gel Electrophoresis")

Nucleic Acid Elution and Purification

Step 64.

Crush the gel slice thoroughly with a disposable pestle. Leave the pestle in the tube.

REAGENTS

Sterile disposable pestles K749521-1500 by Fisher Scientific

Nucleic Acid Elution and Purification

Step 65.

Add 300 μ L of Elution Buffer to each tube and then remove the pestle, ensuring that as much gel as possible has been washed from the pestle.

Nucleic Acid Elution and Purification

Step 66.

Let gel pieces soak at least 2 hours or overnight at room temperature with agitation. DO NOT incubate longer than overnight.

Nucleic Acid Elution and Purification

Step 67.

Pulse spin tubes to collect all eluate from wall and lid.

Nucleic Acid Elution and Purification

Step 68.

Carefully transfer the eluate (including crushed gel) to the top of a Spin-X Centrifuge tube (Sigma). Cutting the end off of a P1000 tip can help in transfer of larger gel pieces. Centrifuge the Spin-X tube at $16,000 \times g$ for 2 minutes. Dispose of the spin filter.

REAGENTS

0.45µm, 2 mL Spin-X Centrifuge tube CLS8162 by Sigma Aldrich

O DURATION

00:02:00

Nucleic Acid Elution and Purification

Step 69.

Add to each tube and mix well*:

50 uL AMPure XP Beads

350 µL Isopropanol

■ AMOUNT

50 µl Additional info:

REAGENTS

Agencourt AMPure XP A63880 by Beckman Coulter

Nucleic Acid Elution and Purification

Step 70.

Incubate at room temperature for 10 minutes. Agitation during this incubation may increase efficiency of recovery.

O DURATION

00:10:00

Nucleic Acid Elution and Purification

Step 71.

Magnetize sample until solution appears clear.

Nucleic Acid Elution and Purification

Step 72.

Wash #1: Carefully remove and discard the supernatant, add 950 μ L 80% ethanol, incubate 30 seconds, and remove.

O DURATION

00:00:30

Nucleic Acid Elution and Purification

Step 73.

Wash #2: Carefully remove and discard the supernatant, add 950 μ L 80% ethanol, incubate 30 seconds, and remove.

O DURATION

00:00:30

Nucleic Acid Elution and Purification

Step 74.

Dry sample for 3 minutes. After one minute, remove all residual liquid that may have collected at the bottom of the tube.

O DURATION

00:03:00

Nucleic Acid Elution and Purification

Step 75.

Remove plate from magnetic rack and resuspend bead pellet in 13 μ L of Resuspension Buffer by pipetting volume up and down. Ensure that beads are completely resuspended and rehydrated.

Nucleic Acid Elution and Purification

Step 76.

Incubate for 2 minutes.

O DURATION

00:02:00

Nucleic Acid Elution and Purification

Step 77.

Magnetize for 5 minutes or until supernatant appears clear.

O DURATION

00:05:00

Nucleic Acid Elution and Purification

Step 78.

Transfer 12 µL of supernatant to a clean 1.7 mL tube. This is your sequencing library.

Nucleic Acid Elution and Purification

Step 79.

Check the size distribution and concentration of the final library by Bioanalyzer High Sensitivity DNA Assay (Agilent).

NOTES

Bioo Scientific 03 Sep 2015

If desired, ethanol precipiatation or other nucleic acid purification methods may be used for purification of supernatant after this step. For ethanol precipitation, it is recommended to transfer eluate from this step to a clean microcentrifuge tube, as pellets can be difficult to handle in the Spin-X tubes.

Warnings

Bioo Scientific strongly recommends that you read the following warnings and precautions. Periodically, optimizations and revisions are made to the components and manual. Therefore, it is important to follow the protocol included with the kit. If you need further assistance, you may contact your local distributor or Bioo Scientific at nextgen@biooscientific.com.

- Do not use the kit past the expiration date.
- This kit contains a single Barcoded Primer. To enable multiplexing, please use the appropriate combination of NEXTflex $^{\text{m}}$ Small RNA Barcodes during the PCR Amplification step.
- Try to maintain a laboratory temperature of 20°-25°C (68°-77°F).
- RNA sample quality may vary between preparations. It is the user's responsibility to optimize the initial RNA input amount to obtain desired PCR bands for gel excision and sequencing. Refer to the Starting Material section for additional information.
- Vortex and micro centrifuge each component prior to use, to ensure material has not lodged in the cap or the side of the tube.
- Do not remove AIR Ligase or T4 RNA Ligase 1 enzymes from -20°C until immediately before use and return to -20°C immediately after use.
- Some total RNA extraction and purification methods may not efficiently isolate small RNAs. Users should verify that their extraction and purification method also isolates small RNAs.
