ABSTRACT

Summary:

This experiment involves a spectrophotometric measurement using Roche Cobas Clinical Chemistry Analyzer. Triglyceride levels may be measured in serum, plasma, and tissue samples. Serum and tissue triglyceride levels are affected by alterations in systemic lipid metabolism, lipid digestion/absorption, and lipid clearance. Serum and tissue triglyceride levels are altered in obesity, insulin resistance, type 2 diabetes, alcoholic steatohepatitis, non-alcoholic fatty liver disease, and non-alcoholic steatohepatitis.

BEFORE STARTING

Notes:

 $\sqrt{\text{Try to use freshly prepared serum and plasma samples for this assay.}}$

√ No dilution or treatment of the sample is required, but plasma samples should be centrifuged to remove any fibrin/fibrinogen

\sim	um	ne	

- $\sqrt{\text{Samples should be stored at 2-8°C for 24 hours prior to analysis.}}$ For longer periods, store samples at -70°C, and avoid repeated freeze/thaw cycles.
- √ A 50 µl dead volume is required in addition to sample volume for multi-protein analysis (typically 1-5 µl).
- 1 Perform daily quality control assessment of instrumentation before analysis.
- 2 Load each sample into a specialized micro-sample cup for the clinical chemistry analyzer.
- 3 Select Triglyceride test on display and run the analysis.
- 4 Collect and analyze the data.
